Morbidity and Mortality

Weekly Report

OCT 1964

U. S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE PUBLIC HEALTH SERVICE

Prepared by the

COMMUNICABLE DISEASE CENTER

634-5131

For release September 25, 1964

ATLANTA, GEORGIA 30333

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED SEPTEMBER 19, 1964

ENCEPHALITIS

A total of 113 cases of primary encephalitis was reported for the week ended September 19. This brings to 2,278 the cumulative total recorded in the United States during 1964.

Of the cases reported during the past week, 45 were from Texas. The Houston epidemic continues to wane since the peak incidence during the week ended August 29.

Through September 21, a total of 692 suspected cases of St. Louis Encephalitis, including 32 deaths, has been reported from Harris County (Houston), Texas. (See previous reports, MMWR, Vol. 13, pp. 290, 302, 312, and 322).

The overall attack rate in the Houston epidemic is 55.7 per 100,000. The highest attack rate has occurred in the age group 70 years and older (139.1 per 100,000).

In addition, 68 suspected cases of encephalitis have been reported to date from the Texas Panhandle region and 34 suspected cases from Colorado. Of the Colorado cases, 7 were confirmed as Western Encephalitis and 3 confirmed St. Louis Encephalitis.

Thirty suspected encephalitis cases are under investigation in Boyle County, Kentucky. At present, there is only presumptive evidence that this is St. Louis Encephalitis.

HUMAN RABIES - Minnesota

The first case of human rabies reported for 1964 occurred in a 10-year-old boy from Wabasha County, Minnesota. On August 5, 1964 the boy was bitten by a skunk on the right wrist and left index and fifth fingers, while sleeping in a tent. His brother, age 3 was also bitten on the wrist. The wounds were not clean puncture wounds but appeared to be chewed.

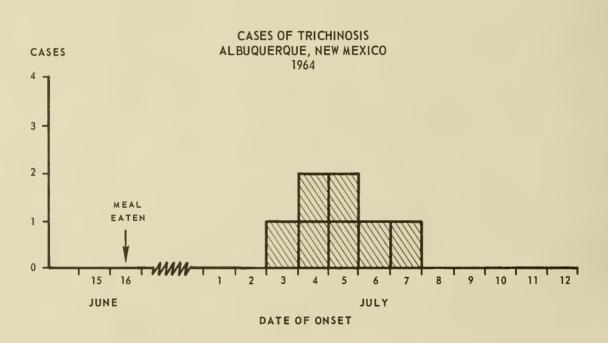

Duck embryo vaccine was administered on the day of occurrence and a total of 14 daily doses were subsequently given. Both children were also given a booster dose of tetanus toxoid.

On August 25, the 10-year-old boy noticed numbness of the right forearm. The next day he had fever and generalized myalgia. On August 27 his temperature was recorded as 101° F and he complained of a stiff neck. The following day he was admitted to a Rochester,

Minnesota hospital because of ascending paralysis, hallucinations, incoordination, stiff neck, and fever to 104° F. He did not convulse or salivate. Cerebrospinal fluid examination revealed 124 cells, all lymphocytes; the peripheral white blood count was 12,700. He expired on September 1 and an autopsy was performed. Fluorescent antibody tests on the boy's brain were negative.

Six mice were inoculated with brain tissue from the patient on September 2. On September 16, one of the mice became paralyzed and was sacrificed.

Negri bodies were demonstrated in the mouse brain by the Williams stain. The fluorescent antibody stain was also positive. The biting animal was not captured. (Reported by Dr. D. S. Fleming, Director, Division of Disease Prevention and Control, Minnesota State Health Department.)

TRICHINOSIS - New Mexico

On June 16, 1964 a group of 12 persons in Albuquerque consumed a common meal of hamburger, salad, and pie. During the first week of July (see graph) 7 of these individuals experienced headache, fever, periorbital edema and generalized myalgia; 6 of the 7 ill had significant weight loss.

All 7 had positive trichinella antigen skin tests and bentonite flocculation serological tests for trichinosis.

Their eosinophile counts ranged from 11 percent to 37 percent.

The hamburger was purchased at a local supermarket. The beef had been ground in a machine just previously used for grinding pork. The hamburgers were eaten rare.

(Reported by Dr. H. G. Doran, Epidemiologist, New Mexico State Health Department and a team from CDC.)

REPORTED CASES OF POST-INFECTIOUS ENCEPHALITIS FOR AUGUST FOUR WEEKS ENDING 8/8, 8/15, 8/22, 8/29

(States not reporting a case nat listed)

POST-INFECTIOUS ENCEPHALITIS - AUGUST

A total of 47 cases of post-infectious encephalitis was reported for the 4-week period ended August 29 (see table above). This brings to 674 the cumulative total of post-infectious encephalitis cases reported for the first 8 months of 1964. (For earlier reports, see MMWR, Vol. 13, pp. 46, 102, 143, 177, 219, 266, and 293).

Post-mumps encephalitis cases number 33 (70 percent of all cases reported). Of this number, California reported 23. A comparison of the cases attributed to mumps, measles and other causes is presented by month in the table below.

There are no cases of post-vaccinia or pertussis vaccine encephalitis reported during this 4-week period.
